Android chat bubble view. Bubble bubble hours. Bubble app examples. Bubble bubble near me. Bubble view android github. Android message bubble view.

Android 11 Hero (Image credit: Joe Maring / Android Central) The Android 11 Beta brings a handful of new features to software that's already filled with features and that presents special problems. Take notifications, for example. Notifications and ways to manage them have always been one of Android's strengths, but it's super-easy to get overloaded when you have a bunch of apps all trying to get and keep your attention. You can usually change settings in an app or through Android's settings to help manage things, but chances are you still get notifications you have no intention of tapping and ones you think are a lot more important mixed up in your notification shade. Android 11 builds on existing tools and settings with two new mini-features, which Google calls Conversations and Bubbles. Notifications that you care about live at the top of your notification list in an area marked for Conversations. The separation between Conversations and other "tiers" of notifications (there are three in total) is well defined and that's where notifications from messenger apps can live and they will always stay at the top of the list. Android 11 Conversation Priority (Image credit: Google) Android 11 Bubbles (Image credit: Google) Source: Google You can also choose the order of these conversations from the notifications themselves as well as reply or mark as read or do most any other action you'd want to take on a notification of this type. And if a conversation is too important to just live in the Conversations area, you can turn it into a chat bubble. You probably already know how Android 11's bubbles work because the idea isn't all that new; we've seen bubbles in Facebook Messenger for a while now. Android's notifications system is already great so the trick is not to screw it up. If you're not familiar, a bubble is a conversation that has a floating icon which will pop up and overlay no matter what you're doing on your phone. It provides a quick way to get to a pop-open rich-text messaging bubble of the conversation itself, then you can swipe it away once you're done with it. Let's say, for example, I'm talking to a family member through an app that supports bubbles, like Android Messages once it gets turned on, I'm doing plenty of back and forth chatting but also reading the news or scrolling through social media. I can open the conversation in a bubble that can open a "new window" of the conversation without leaving Google News or Instagram or whatever app I'm using at the time. Source: Joe Maring / Android Central (Image credit: Source: Joe Maring / Android Central) Neither of these features seems all that groundbreaking. Bubbles are kind of a gimmick — at least the floating head aspect of it — but it does offer convenience, which is why Facebook has had so much success with it in Messenger. Conversations is obviously building on Android 10's notification management system, which is a bit convoluted and manual. What Android 11 needs in the notifications area is a bit of spit and polish to existing ideas, and that's exactly what it looks like we're getting here. No complaints from me! Have you listened to this week's Android Central Podcast? Every week, the Android Central Podcast brings you the latest tech news, analysis and hot takes, with familiar co-hosts and special guests. Subscribe in Pocket Casts: AudioSubscribe in Spotify: AudioSubscribe in iTunes: Audio (opens in new tab) The most prominent new feature in Android Nougat 7.0 is Multi-Window (also called split-view) multitasking, a long-overdue addition to the mobile operating system. Formerly found only in customized Android skins such as Samsung TouchWiz, this mode enables you to view two apps at once. It's great for when you want social media or your email inbox visible while you browse the web or edit photos. Unfortunately, it's not exactly easy to figure out how to make it work. Below, we'll show you how to select a second app to place side by side with the one you're already using, and how to select an app not shown in the app switcher. Here's how to use multi-window views in Android Nougat 7.0: 1. While in an app, hold down on the Recent Apps button. 2. Select an app from your recent apps. If the app you want doesn't appear in that view, tap the Home button. Not all apps support multi-window mode, and you'll see a warning if that's the case for apps you select. 3. Tap a second app. You've set up split-view! Drag the dividing line left and right to resize, tap Home to find a new secondary app from the home screen and tap the Split Screen button in the bottom right corner to select a recently used app. Updated: 09/16/2021 by Computer Hope View may refer to any of the following: 1. In general, view refers to seeing an object or the contents of a file on a computer. For example, you are currently viewing this web page to learn more about view. 2. In Windows Explorer, View, Views, or the Views button is an option that lets you change how the folders and files are shown. See our view buttons definition for further information and related links. 3. With Linux, view or vi is a command that lets you view and edit files. See the vi command page for further information on this command. 4. With online advertising and statistics, a view is another name for a page view. 5. View is also used to describe the angle of view with a camera or camera lens. Open. Software terms. Viewable area The notification "Bubble" is a feature introduced in Android 11 that works like Facebook Messenger's "Chat Heads." Conversations can be popped-out into windows that overlay your current activity. If you don't want to use Bubbles, it can be disabled. Bubbles are an opt-out feature, meaning they're enabled by default. When an app presents a Bubble for the first time, you'll have the option to turn off Bubbles for that specific app. If you'd like, it's also possible to turn off Bubbles for all apps entirely. Disable Bubbles for Specific Apps On your Android phone or tablet, swipe down from the top of the screen (once or twice depending on your device's manufacturer), and then tap the Gear icon to open the "Settings" menu. Scroll down and select "Apps and Notifications." At the top of the screen, select "See all (X) Apps," where "X" is the number of apps you have. Tap the app you don't want to use Bubbles. Select "Notifications." Finally, tap "Bubbles." Switch the setting to "Nothing Can Bubble." Now, whenever you receive a new message in that app, you'll no longer see a Bubble. Disable Bubbles for Specific Conversations When an app supports Bubbles, you'll see a little icon in the bottom-right corner of the notification. Tap it to move the conversation to a floating window. Tap "Manage" under the pop-up window. This opens a context menu of options for the app. Tap "Don't Bubble Conversation" to disable Bubbles for this specific conversation. Disable Bubbles Entirely If you'd rather disable the notification Bubbles for all apps, you can do that, too! On your Android phone or tablet, swipe down from the top of the screen (once or twice depending on your device's manufacturer), and then tap the Gear icon to open the "Settings" menu. Select "Apps and Notifications." Next, tap "Notifications." In the top section, tap "Bubbles." Toggle-Off the switch for "Allow Apps to Show Bubbles." Now, no apps will be able to use Bubbles. You can return to this screen any time to re-enable the Bubbles feature. By Kathryn Hatashita-Lee | pressureUA/iStock/Getty Images Your Android's Web browsers provide a history of your searches with the most recent sites listed first. This browsing history can bring up each entry in a new tab for quick access. Your browser apps also enable you to manage your log with the option to remove this search history for your privacy. Google Chrome logs your searches and displays the date and time on the History screen. The Chrome Menu button near the Omnibox includes the History options. The log displays searches in reverse chronological order, with the most recent searches at the top and the oldest searches at the bottom. Each entry includes the time in a 24-hour format, such as 19:00 for 7:00 p.m. The "X" button on each field enables you to remove this website from the History. The Clear Browsing Data button opens the checklist with preferred options, such as Clear Browsing History and Clear Autofill Data, to manage your logged searches. The Mozilla Firefox app also logs your searches in reverse chronological order. When you hold your tablet in a horizontal position, tapping the header's dark gray corner next to the first tab expands a sidebar with a "+" icon at the bottom. Tap this "+" icon to display three tabs: Top Sites, Bookmarks and History. Tap "History" to view the log for your searches. Section headings include Today, Yesterday, 7 Days Ago and Older than 7 Days. This Firefox History tab does not sort by the exact date or time as the Google Chrome app does. Pressing and holding a website link brings up the pop-up window. Select one of these options: "Open in New Tab," "Share," "Remove" or "Add to Home Screen." Opera Mini provides the "O" menu icon in the navigation bar with a drop-down menu that includes the History button. Tap the "History" icon to open the History window with the most recent site at the top of the list. The Clear All button erases your Web searches. UC Browser includes a Menu button displaying the Bookmarks/History icon in the General tab sheet. Tap "Bookmarks/History" to open the next screen, and then tap the "History" tab to open your search log. The Manage button at the lower screen filters your entries. For example, tap "Manage" and then tap "By Date" on the menu. Your searches display in sections for Today, Yesterday and Two Days Ago. The Clear button will delete your browsing history. Smart phone notifications can be overwhelming. They can also be, well, boring, hidden away as little rectangles at the top of your screen and looking mostly the same. If you want to spice up your notifications a little, consider taking advantage of one of Google's fun alert features: chat bubbles. How do chat bubbles work on Android? On Android, bubbles allow you to set chat notifications as little circles that appear on your phone's screen. They're small enough to not distract from what you're up to, but always available if you need to respond to a quick message. You can quickly enter a conversation, which opens a separate window on-screen, and easily dismiss that window back into the bubble so you can keep doing whatever it is you're doing. If you haven't seen these bubbles on your phone yet, that's because you need to activate them yourself. Fortunately, it's easy to do so long as you're running Android 11. To check if you're running Android 11, head to Settings > About phone > Android version. G/O Media may get a commission. How to enable chat bubbles on your Android To start, make sure the feature is turned on. Head to Settings > Notification > Bubbles, then ensure the toggle next to "Allow apps to show bubbles" is enabled. Open your notifications by swiping down from the top of the display. Locate an unread notification from a messaging app. If it supports bubbles (and not all chat apps do) you'll see a little box with a dot in the bottom right of the notification window. Tap that icon, and the notification will jump alive, opening the chat window connected to a bubble, or "chat head." When you're done with the chat, just tap outside the window to minimize it back into the bubble. That bubble now lives on your screen, so you can go about your business until you want to jump into the conversation again. You can also view other recent bubbles by tapping the "X" that appears when tapping the active chat bubble on-screen. How to remove chat bubbles from your screen There are a few ways to get rid of chat bubbles, some temporary, and some permanent. Let's start with temporary: Tap and drag the bubble to the bottom of your screen, where you'll find a large "X." Drag the bubble over the "X" and let go to dismiss the bubble. Alternatively, tap the bubble, then tap "Manage" at the bottom of the screen. Now, you can tap "Dismiss bubble," which will remove it from your screen temporarily. The next time you receive a message from that app, however, the bubble will pop back up on your display. If you want to remove chat bubbles from your display permanently, it's just as easy. Tap the chat bubble again, tap "Manage," then tap "Don't bubble conversation." This option will not only dismiss the chat bubble, but it will disable chat bubbles for that conversation. That won't stop other conversations in that app from appearing as bubbles if you've selected that, however. To stop an app from appearing as a bubble altogether, you'll need to go one step further. How to turn off chat bubbles for an app Head to Settings > Notifications > App settings, then choose the app in question. If the app supports bubbles, tap "Bubbles," then choose "Nothing can bubble." If that option doesn't appear here, but you know that the app supports bubbles, scroll down and tap "Additional settings in the app," as the option might be in the in-app settings instead.
